do same most advanced technique of research analysis of the below

Navigation Tabs/Pages
Each store/workflow accessible via tab/page; sticky navigation for fast context switching.

Here is a most advanced, research-driven analysis and user story for **Navigation Tabs/Pages**—delivering context switching, modularity, and usability for compliance SaaS.

Story Title

Navigation Tabs/Pages: Fast Context Switching for Workflow Productivity

Description

Build a next-generation tab/page navigation framework that enables compliance users to move seamlessly across every business process, store, and action point for maximum efficiency and audit accuracy:

- **Modular Tabbed Interface**: Every key store or workflow (Partner, Product, Order, License, Audit, Docs, Exceptions, Rules, Training) accessible as its own persistent navigation tab or grouped "zone" along the UI's sticky top, side, or floating navbar.

- **Role-Smart Landing and Dynamic Tabs**: On login, land users on their most relevant workspace by role (e.g., Analyst, Approver, Auditor), with only the tasks/modules they need; dynamically add/remove tabs based on access rights, region, and urgency.

- **Sticky/Pinning Navigation**: Tab bars and quick-link sidebars remain visible as users scroll, triage alerts, or launch drilldowns—enabling always-on toggling without losing place or context.

- **Alert & Context Awareness**: Tabs display real-time "pill" count of pending tasks/alerts, overdue checks, or system messages; highlight which modules need attention at-a-glance.

- **Multi-Tab/Window Support**: Permits users to open multiple workflows/entities in parallel tabs—supports complex cross-referencing, audit prep, or multitasking across cases and entities.

- **Drill-Down & Cross-Linking**: Every entry list, chart, or report enables one-click jump to detail pages (e.g., click partner in Audit log tab to open Partner tab with context loaded).

- **Advanced Filtering/Switching**: In-page tab filters for region, legal entity, status, or transaction type—remember filter state as users switch between tabs or return from details.

- **Roadmap for Keyboard Shortcuts & Accessibility**: Tab/jump navigation fully accessible, keyboard friendly (tabindex, ctrl+tab, etc.), with support for screen reader announcements.

Acceptance/Impact Benchmarks

- ≥95% of users complete their core daily workflows without more than three clicks/toggles from landing, regardless of data volume or workflow complexity.
- Tabs/sidebars dynamically update for user role and permissions within 1s of login/context switch.
- "Sticky" navigation demonstrated to save users >30% navigation time per session vs. legacy multi-page UIs in user testing.
- All major workflow and compliance events are reflected in real-time tab alerts with drilldown; no critical event is missed.
- Multi-tab and context/alert preservation measured in regression and usability testing; users keep data/context on tab/page switches.

Innovation & Market Insights

- Market research shows that "orchestration" and user-centric navigation are a top differentiator for SME and global compliance teams—poor navigation is cited as a leading productivity and error risk.
- AI-driven, context-aware navigation that highlights urgent areas (rather than static menus) is emerging as best practice to power user adoption and SLA success.
- Advanced tabbed experiences should be mobile and accessibility optimized, with a vision for AI-powered "next best tab"/"context jump" in future releases.

Explicit stories and UATs on navigation tabs/pages ensure the compliance experience is not just powerful, but truly usable and scalable as processes and teams grow.
