Regulatory Updates
Auto-list/rule ingestion, impact analysis dashboard, change/evidence tracking

Here is a comprehensive, research-based user story and implementation plan for **Regulatory Updates**—covering automated list/rule ingestion, impact analysis dashboards, and change/evidence tracking, and tailored for a modern compliance SaaS platform. This covers needs from SME to enterprise, and independent of "out-of-the-box" vendor limitations. [1] [2] [3] [4] [5] [6] [7]

Regulatory Updates – Full-Fledged User Story & Strategic Research

Title

Automated, Explainable Regulatory Updates With Impact Analysis and Evidence Log

Description

As a compliance officer, product owner, or IT admin, I want our compliance platform to automatically ingest new and updated regulatory lists (e.g., sanctions, HS/ECCN, license guidelines), update platform rules and data, flag all impacted business flows, and provide a "who-what-when-why" audit trail—so we never miss a change and are always ready to demonstrate compliance to internal and external stakeholders.

360-Degree Functional Requirements

1. Automated List & Rule Feed Integration

- Auto-ingest regulatory/sanctions lists (OFAC, BIS, EU, UN, UK, APAC, industry lists) via API, official feed, or scheduled download. [2] [1]
- Monitor public regulatory portals and any required subscription feeds for updates to license guidelines, quotas, embargoes, and product/class codes.
- Parsing engine supports varied inputs (XML, JSON, CSV, PDF/text, web scraping if required), with error/duplication/format checking.

2. Rulebase, Classification, and List Synchronization

- New/updated rules and lists route into a staging/sandbox area for review and testing before activation.

- Human-in-the-loop approval throttle: compliance manager reviews summary of changes with "auto-map" suggestions (e.g., new Russian SDN matches).
- Built-in version control and rollback—restore any past rule/list/version.
- Platform creates a change-diff summary: what changed, why, and auto-generated guess at business/process impact. [1]

3. Impact Analysis Dashboard & Change Visualization

- Dedicated dashboard visually summarizes current/previous changes, color-codes impacted products, partners, licenses, and in-flight orders. [6] [2]
- "What-if" analysis mode: simulate the effect of upcoming rules/lists before system-wide publish.
- Alerts show number of previously-cleared items now flagged by new regulation, and any "grandfathered" exceptions.

4. Automated & Manual Change Evidence Tracking

- All changes, approvals, and rollbacks are time- and user-stamped, with notes, supporting documents (official government notices, legal reviews), and API logs attached.
- Downloadable "change pack" PDF/CSV including raw regulation text, change summary, approval/denial reasons, and impact snapshot for auditors.
- Audit log and tracking meets BIS, OFAC, EU, and local regulator requirements for evidence of proactive, documented regulatory review.

5. Proactive Alerting and Flexible Scheduling

- Responsible users receive notification upon detection of impactful changes—before publishing to production.
- User-configurable ingestion frequency (hourly, daily, weekly, by region/list) and per-jurisdiction "hard cutover" (e.g., newly embargoed country is blocked instantly).
- Option to auto-publish "low-impact" changes but require review for major-country, product, or risk code shifts. [3] [2]

6. API & Integration with System Owners

- Open REST APIs for pushing/pulling regulatory lists, querying change history, and exporting evidence packs/custom rules.
- Integration hooks for ERP/OMS to trigger new screenings as soon as list/rule updates go live; avoids missed or delayed blocks/releases. [2] [6]

7. Advanced Security & Privacy for Regulatory Data

- Ingested list/rule data stored encrypted, with access limited per data sovereignty, legal entity, and appointed compliance roles.
- Tracking logs show exactly who processed, reviewed, and escalated what data when.

Acceptance Criteria

- 100% of sanctions/list/rule updates in scope are ingested, parsed, and logged with evidence/timestamp.
- All impacted master data/entities (partners, products, orders, licenses) are highlighted on the impact dashboard with context.
- Audit-ready report download can be generated for all regulation changes for any past period.
- System retroactively flags/remediates already-approved orders if post-hoc rule changes make them risky.
- Tested with at least two major live regulatory list events with no missed blocks/false releases.

Innovations and Market Fit

- Most legacy systems only support "manual" list uploads or require third-party add-ons, risking delayed/block errors.
- Low-code "staging plus explain" with automated evidence and who-signed-when solves regulator, customer, and board review risks.
- True competitive edge: simulated impact and rollback, live dashboards for policy, legal, exec, compliance, and operational teams. [5] [3] [1] [2]

Subtasks & QA

- Build ingestion/parsing scheduler, sandbox mode, UI, and audit pipeline.
- Develop visualization for change summary, entity impact, and download pack generator.
- Implement notifications and "what-if" analysis with end-user feedback on pilot/simulated regulatory changes.
- Security test all APIs, logs, retention flows—GDPR/PIPL/SEC/OFAC approval.

This gives you a system that anticipates and outpaces global regulatory change—ready for tomorrow's "overnight sanctions" and legal audits, not just today's routine updates. [4] [7] [3] [5] [6] [1] [2]
